

Sealing work - Prescenyklause

A beautiful landscape and crystal-clear water make underwater work a true pleasure. Our professional divers are assisting with sealing work on the historic Prescenyklause dam.

Originally used for log driving, the dam has served as a power plant since 1987, housing two Voith turbines. This cavern power plant is hidden within the mountain.

The underwater work ensured that water flows smoothly through the turbines.

Our team thanks you for the excellent cooperation and is already looking forward to the next assignment in the beautiful Mariazell region.
