GS BOOSTER SETS SERIES

GENERAL INTRODUCTION - PRODUCT DESCRIPTION

The GS series pressure booster units mainly comprise electric pumping stations assembled with two or three SV series vertical multistage electric pumps. A smaller electric pump can also be added to the main ones. Generally known as a jockey electric pump, it provides for minor usages in order to maintain system pressure without starting the service electric pump.

The GS series pressure booster units are constant speed sets and are used to distribute water in heating or filling systems. On demand jockey electric pump informations are available. The electric pumps are mounted on a single base together with the other hydraulic components, such as on-off valves, check valves and the delivery and return manifolds.

The electrical panel, supplied with a mounting bracket, is attached to the pressure booster unit base.

The electric pumps start and stop according to the signals sent by the pressure transducer to the electrical control panel.

The latter is fitted with an integrated electronic board. The electric pumps start and stop automatically depending on the water demand of the system.

These pressure booster systems are combined with expansion vessels (hydrotube) in order to guarantee stable operation and reduce the starting frequency of the electric pumps.

For the correct choice in capacity of the expansion vessels, see the relative chapter on page 103 of the catalogue.

GS series booster sets with e-SV series electric pumps are certified for use with drinking water.

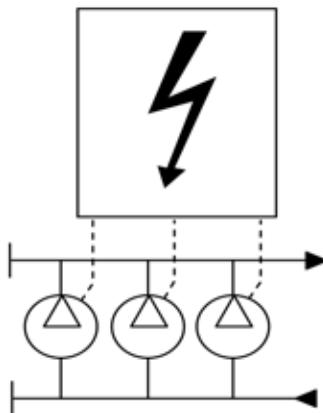

GS series booster sets are available with a wide range of electric pumps to satisfy the different needs of every system. GS booster sets are also available in special version to fit specific duty points and applications.

GS BOOSTER SETS SERIES

DESCRIPTION OF OPERATION

The electric pumps start and stop according to the set pressures detected by the pressure transducer, thus ensuring the required amount of water is delivered. The pressure values can be directly set on the electronic board.

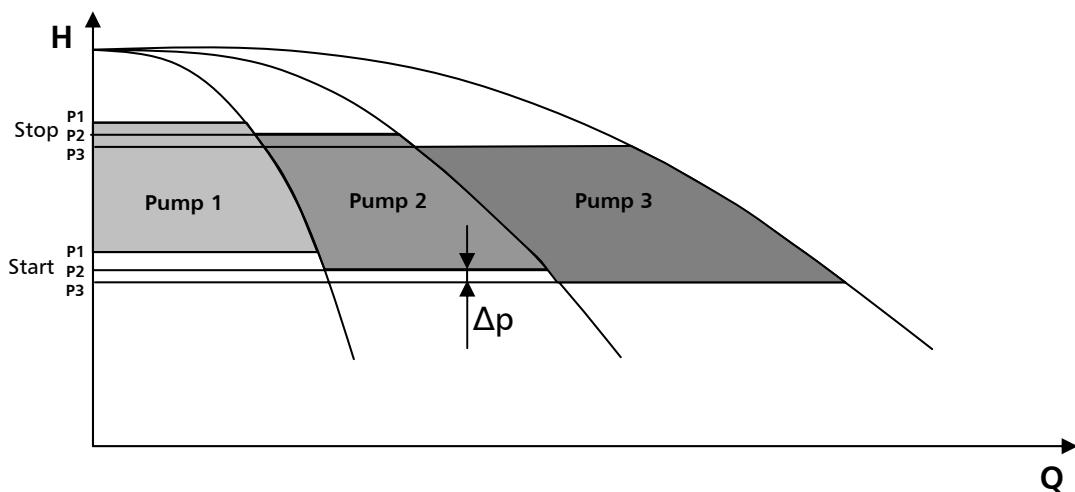

For units with jockey electric pump, the latter will start first and stop last, depending on the set pressure values. When a tap is opened, the pressure starts to fall until it reaches the starting value of the first electric pump. If the delivery of water increases, the pressure falls even further and the other electric pumps start in sequence according to the demand for water.

When consumption falls, the pressure in the system increases and the electric pumps stop when the set threshold pressure values are reached.

If consumption falls to zero user demand, the last electric pump also stops.

If the "timer" function is used, the last electric pump to work will remain operating for a set time after it is switched off, in order to reach maximum pressure. Make sure the maximum pressure is compatible with the system in which the pump is installed.

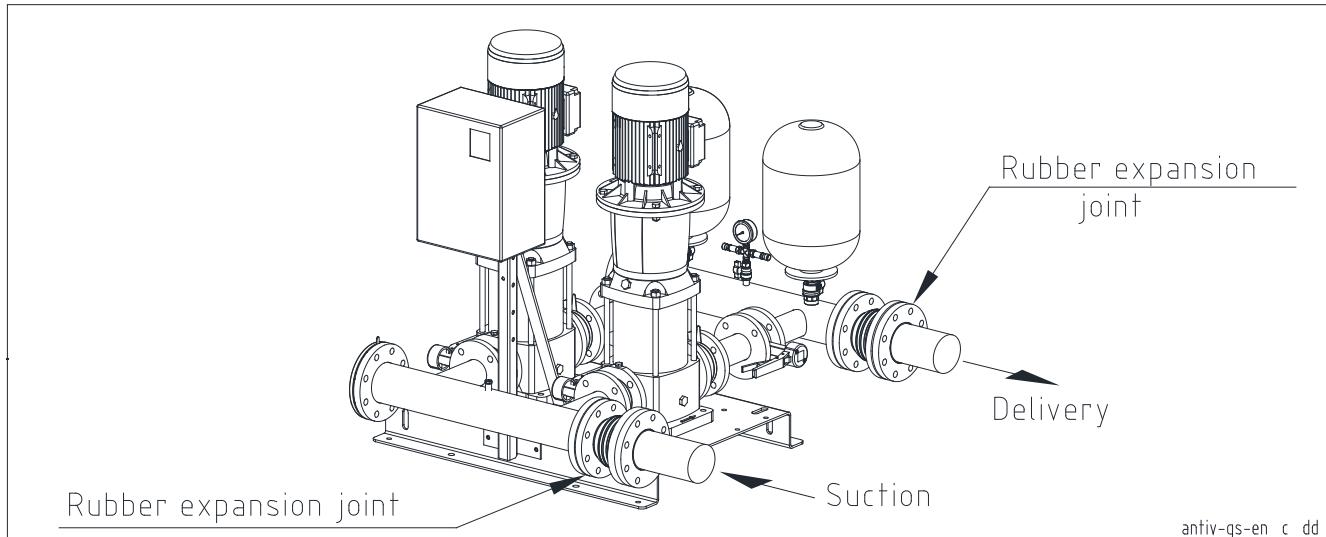

Example of operation.

Δp pressure differential between electric pumps, can be reduced to 0,5 bar.

GS BOOSTER SETS SERIES INSTALLATION

The booster sets must be installed in areas protected against frost and with adequate ventilation to cool the motors. It is a good practice to connect the booster set to the suction and delivery pipes of the system inserting vibration-damping joints to limit the transmission of vibrations and resonance to the system.

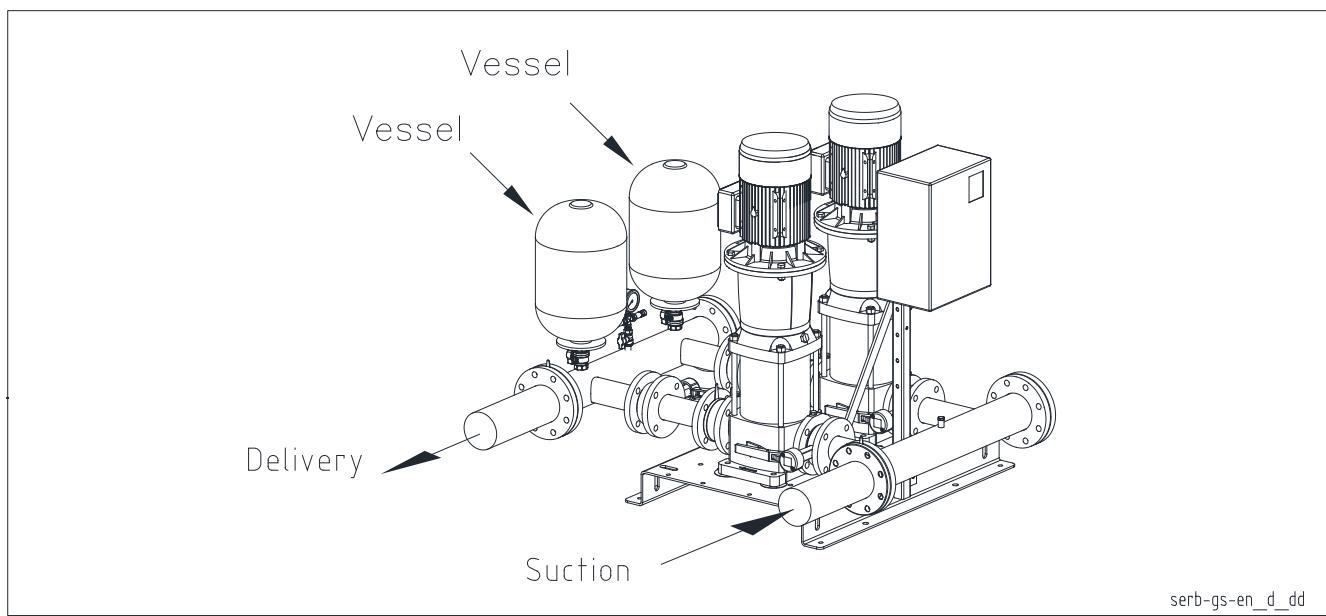

The booster sets must be connected to pressurised tanks with an adequate capacity for the system to be made. These tanks can avoid any problems due to water hammer that is created due to the sudden stopping of the electric pumps.

For this type of system, it is possible to install in the delivery piping diaphragm expansion vessels (hydro tube) that perform a pressure dampening function. It is always recommended to check the type of system to be made and choose the correct capacity of the vessels accordingly. The total volume could be divided into two or more vessels.

For the sizing of the expansion vessels, see the specific chapter in this catalogue.

It is good practice to check the value of the maximum electric pump pressure to match the set with a vessel suitable for the pressure value.

GS BOOSTER SETS SERIES

SUCTION CONDITIONS

Installation of the pressure booster set must be assessed especially as regards intake conditions. Intake conditions can negatively or positively affect the performance of the pressure booster unit and consequently system performance.

A positive suction head is ideal for a pressure booster unit as it keeps the electric pumps constantly primed and the positive difference in level adds pressure to the system.

A negative suction head is different. In this case, the risks for the electric pumps are priming which is connected with the intake piping, the NPSH of the electric pump and the difference in level between the electric pump and the water in the tank.

In this type of installation, after checking the intake capacity of the electric pump, the overall pressure drop in the intake line must be calculated as this will reduce electric pump performance and consequently that of the pressure booster unit.

In order to select the right pressure booster unit, the performance levels of the electric pumps installed on them are indicated in this catalogue. To simplify the calculation of net pressure, pressure drop curves, both for the delivery and intake lines of the electric pumps have been included (see the relative chapter).

CHOICE AND SELECTION

The demand of a water distribution system is generally determined by the designer according to the type of user structure being served.

Users can be schools, hospitals, homes, offices, industries, hotels, shopping centres and for each the water demand changes due to the different requirements of the people living and working in these structures.

Integral system calculation, instead, prevents excessive oversizing and therefore reduces running and installation costs.

The theoretical water demand is calculated by summing the demand of each user. As, however, it is improbable that all users will want to use water at the same time, real demand is lower than theoretical demand.

After defining the flow rate of the system, the head must be calculated. This must consider the following:

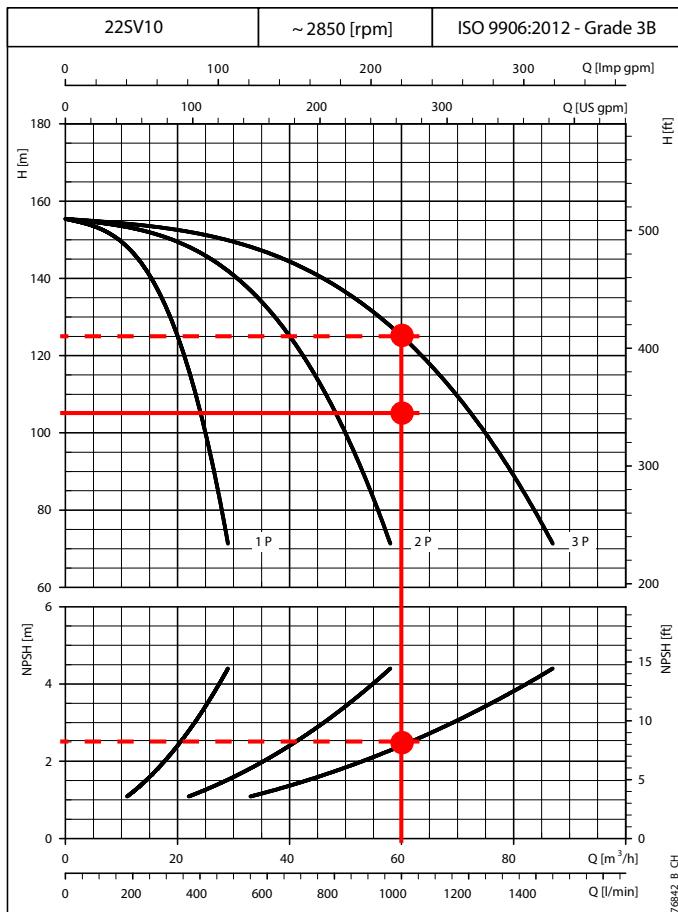

- geodesic head: difference in level between the electric pumping station and the highest user
- residual head: pressure demand from the most unfavourable user to serve
- pressure drops: value in metres of pressure drops due to friction in the delivery pipes
- inlet height: difference in level between the electric pump inlet and the surface of the water in the tank (positive or negative depending on the installation type)
- inlet pressure drops: value in metres of pressure drops due to friction in the inlet piping and in any curves and valves.

After analysing the above, the head required for the system is calculated.

Now that the flow rate and head values are known, the most suitable pressure booster unit for the system can be chosen. The designer must decide whether to choose a pressure booster unit with two or three electric pumps, the third being a reserve electric pump satisfying demand during electric pump maintenance periods.

GS BOOSTER SETS SERIES SELECTING THE ELECTRIC PUMPS

The choice of electric pump is therefore based on the characteristic curve of the electric pump depending on the flow rate and the pressure required for the system. Starting from the required flow rate, a vertical line is drawn until it meets the horizontal line of the required pressure. The point of intersection of the lines gives both the type and the number of electric pumps necessary for the system.

The example alongside refers to a required flow rate of $60 \text{ m}^3/\text{h}$ and a pressure of 105 m water column

As shown in the operating curves on page 73, the selection requires three 22SV10 electric pumps.

Moreover the take-off point falls in the npsh area farthest to the left and therefore in an area with a low cavitation risk.

The values obtained are those for the performance of the electric pumps. A correct check of the net pressure value must be made due to the intrinsic load loss of the booster set and the conditions of installation.

For this reason it is recommended to see the specific chapter in this catalogue.

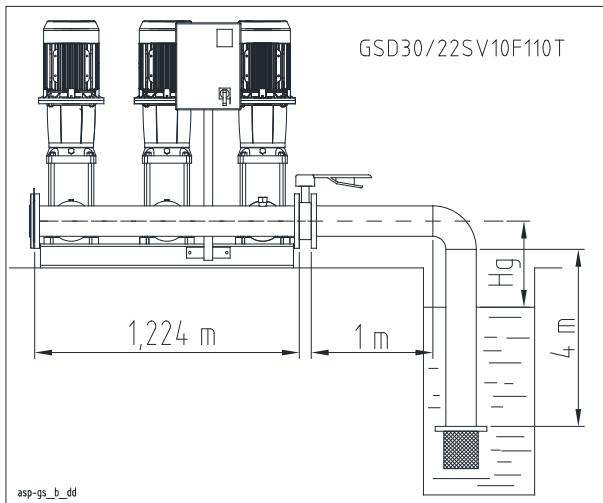

NPSH

The minimum operating values that can be reached by the electric pump suction are limited by the appearance of cavitation. Cavitation consists in the formation of steam pockets in the liquid when the local pressure reaches a critical value. A critical value is when the local pressure is equal or just below the pressure of the liquid steam. Steam cavitation flows with the current. When it reaches a higher pressure area, condensation of the contained steam occurs. The pockets collide, causing pressure waves that are transmitted to the walls, which are therefore subjected to stress cycles that can cause deformation and then breaks due to fatigue.

This phenomena, characterised by a metallic noise due to the hammering of the walls, is called incipient cavitation. Cavitation damage can be made worse by electrochemical corrosion, and by local temperature increases due to the plastic deformation of the walls. The materials with the highest resistance to heat and corrosion are alloyed steels, and particularly austenitic steels. The conditions that cause cavitation can be predicted by calculating the total suction height, indicated in the technical literature with the acronym NPSH (Net Positive Suction Head). The NPSH represents the total energy (in m) of the flow measured at the suction in incipient cavitation conditions, net of the steam pressure (in m) of the fluid at the input of the electric pump.

GS BOOSTER SETS SERIES SUCTION CONDITIONS

Once the type and the number of electric pumps of the set have been identified, the suction conditions must also be assessed. Below is an example of the assessment of the suction lift installation conditions, in relation to the previously described case:

in suction lift installation, it is necessary to calculate the maximum Hg height - which must not be exceeded due to safety reasons -, to avoid cavitation, and therefore the unpriming of the electric pump itself.

The relation that must be assessed, and which connects this value, is the following:

$NPSH_{available} \geq NPSH_{required}$, when the equality condition represents the limit condition.

$$NPSH_{available} = P_{atm} + Hg - \sum t - \sum a$$

Where:

P_{atm} is the atmospheric pressure, equal to 10,33 m

Hg is the geodetic level difference

$\sum t$ are the pressure drops for suction components such as foot check valve, suction piping, curve, gate valve.

$\sum a$ are the pressure drops for suction set branch.

$\Delta NPSH_{requested}$ is a parameter obtained from the performance curve; in our case, at the flow of each electric pump equal to $20 \text{ m}^3/\text{h}$, it corresponds to 2.5 m (page 73). Before calculating the $\Delta NPSH_{available}$, it is necessary to calculate the pressure drops at the suction, using the tables on page 101-102, and taking into account the material, such as the type of stainless steel for the piping and cast iron for the valves.

The total sum of the pressure drops $\sum t$ for suction components is made in the following way, considering that the diameter of the suction piping is DN100, equal to the diameter of the suction manifold of the set (page 52).

Calculation of suction drops $\sum c$ for cast iron components

Equivalent piping length for DN100 foot check valve = 4,7 m

Equivalent piping length for DN100 gate valve = 0,4 m

Total equivalent length = $4,7 + 0,4 = 5,1 \text{ m}$

Pressure drops in the suction piping (cast iron) $\sum c = 5,1 \times 7,79 / 100 = 0,39 \text{ m}$

Calculation of suction drops $\sum s$ for stainless steel components

Equivalent piping length for DN100 90° curve = 2,1 m

Total equivalent length = 2,1 m

Horizontal suction pipe length = 1 m

Vertical suction pipe length = 4 m

Pressure drops in the suction piping (stainless steel) $\sum s = (2,1 + 4 + 1) \times 7,79 \times 0,54 / 100 = 0,29 \text{ m}$

Pressure drops for suction components $\sum t = \sum c + \sum s = 0,39 + 0,29 = 0,68 \text{ m}$

The total sum of the pressure drops $\sum t$ for suction components is made in the following way, considering that the diameter of the suction piping is DN100, equal to the diameter of the suction manifold of the set (page 52).

Hc pressure drops for suction set branch must be assessed on the B curve (pag.90, scheme B0401_A_CH); at the flow value of each electric pump equal to $20 \text{ m}^3/\text{h}$, a value of $Hc = 2,7 \text{ m}$ is obtained

Calculation of suction drops $\sum s$ for stainless steel components

Equivalent piping length for DN100 manifold T fitting = 4,3 m

Suction manifold length = 1,224 m

Pressure drops in the suction manifold (steel) $\sum t = (4,3 + 1,224) \times 7,79 \times 0,54 / 100 = 0,23 \text{ m}$

Pressure drops $\sum a = Hc + \sum s = 2,7 + 0,23 = 2,93 \text{ m}$

Remembering that $NPSH_{available} = P_{atm} + Hg - \sum t - \sum a$ and that $NPSH_{available} \geq NPSH_{requested}$ we have that $P_{atm} + Hg - \sum t - \sum a$ must be $\geq NPSH_{requested}$.

Substituting the values we get that $10,33 + Hg - 0,68 - 2,93 \geq 2,5 \text{ m}$ ($NPSH_{requested}$),

$Hg = 2,5 + 0,68 + 2,93 - 10,33 = - 4,9 \text{ m}$, it represents the limit condition for which

$NPSH_{available} = NPSH_{requested}$

Therefore, in order to guarantee the conditions for the correct operation of the system as far as cavitation risks, it will be necessary to position the electric pump above the water level, **so that the Hg height is below the limit value of 4,9 m.**

GS BOOSTER SETS SERIES

NET PRESSURE CALCULATION

When selecting GS booster sets, the performance levels of the electric pump must be taken into account. Performance levels are obtained from the characteristic curves of the electric pumps, and do not take into account any pressure drops due to system piping and valves. The following example helps the customer to obtain the correct delivery manifold pressure value: by knowing the system operating point $Q = 60 \text{ m}^3/\text{h}$ and $H = 105 \text{ mca}$ (P requested), and the installation height H_g (estimated to 5 m), in order to make the calculations easier we use the pressure drop curves for each single electric pump on page 90 of this catalogue.

Assuming that a booster set GHV30/22SV with non-return valves on the delivery has been selected, we proceed as follows:

$P_{\text{net available}} \geq P_{\text{requested}}$, when the equality condition represents the limit condition.

$$P_{\text{net available}} = H - (H_g + \sum t + \sum a + \sum m)$$

Where:

H head value of booster set

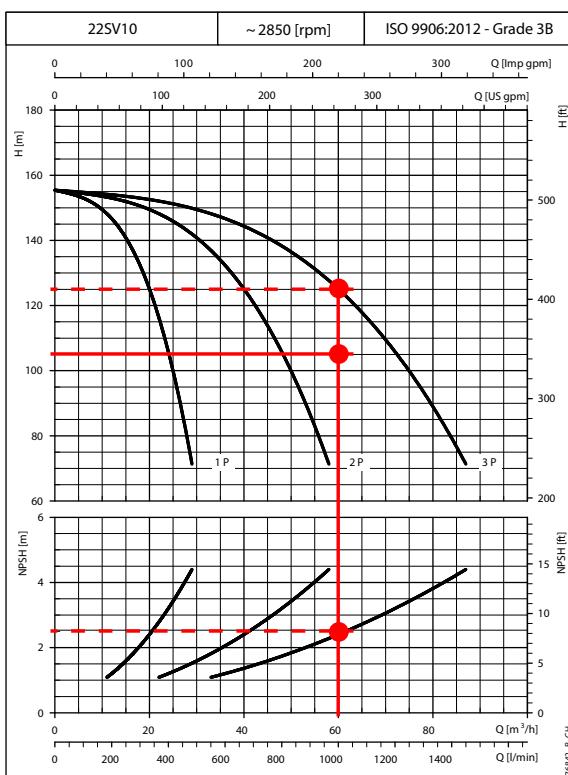

H_g is the geodetic level difference (estimated to 5 m)

$\sum t$ are the pressure drops for suction components such as foot check valve, suction piping, curve and gate valve.

$\sum a$ are the pressure drops for suction set branch

$\sum m$ are the pressure drops for delivery set branch

The total sum of the pressure drops $\sum t$ for suction components is made in the following way, considering that the diameter of the suction piping is DN100, equal to the diameter of the suction manifold of the set (page 52).

Calculation of suction drops $\sum c$ for cast iron components

Equivalent piping length for DN100 foot check valve = 4,7 m

Equivalent piping length for DN100 gate valve = 0,4 m

Total equivalent length = $4,7 + 0,4 = 5,1$ m

Pressure drops in the suction piping (cast iron) $\sum c = 5,1 \times 7,79 / 100 = 0,39$ m

Calculation of suction drops $\sum s$ for stainless steel components

Equivalent piping length for DN100 90° curve = 2,1 m

Total equivalent length = 2,1 m

Horizontal suction pipe length = 1 m

Vertical suction pipe length = 4 m

Pressure drops in the suction piping (stainless steel) $\sum s = (2,1 + 4 + 1) \times 7,79 \times 0,54 / 100 = 0,29$ m

Pressure drops for suction components $\sum t = \sum c + \sum s = 0,39 + 0,29 = 0,68$ m

The total sum of the pressure drops $\sum t$ for suction components is made in the following way, considering that the diameter of the suction piping is DN100, equal to the diameter of the suction manifold of the set (page 52). H_c pressure drops for suction set branch must be assessed on the B curve (pag.90, scheme B0401_A_CH); at the flow value of each electric pump equal to 20 m³/h, a value of $H_c = 2,7$ m is obtained

GS BOOSTER SETS SERIES

NET PRESSURE CALCULATION

Calculation of suction drops $\sum s$ for stainless steel components

Equivalent piping length for DN100 manifold T fitting = 4,3 m

Suction manifold length = 1,224 m

Pressure drops in the suction manifold (steel) $\sum t = (4,3 + 1,224) \times 7,79 \times 0,54 / 100 = 0,23$ m

Pressure drops $\sum a = H_c + \sum s = 2,7 + 0,23 = 2,93$ m

The total sum of the pressure drops $\sum m$ for delivery branch is made in the following way, considering that the diameter of the delivery manifold is DN100, equal to the diameter of the delivery manifold of the set (page 52). H_c pressure drops for delivery set branch must be assessed on the A curve (pag.90, scheme B0401_A_CH); at the flow value of each electric pump equal to 20 m³/h, a value of $H_c = 0,0034$ m is obtained

Calculation of delivery drops $\sum s$ for stainless steel components

Equivalent piping length for DN100 manifold TEE fitting = 4,3 m

Delivery manifold length = 1,224 m

Pressure drops in the delivery manifold (steel) $\sum s = (4,3 + 1,224) \times 7,79 \times 0,54 / 100 = 0,23$ m

Pressure drops in delivery manifold $\sum m = H_c + \sum s = 0,0034 + 0,23 = 0,2334$ m

If we analyse the performance of the set at the flow value of 60 m³/h, the head value H is 125 m.

The net pressure at the delivery manifold will be $P_{\text{net available}} = H - (H_g + \sum t + \sum a + \sum m)$

Substituting the values we get that $P_{\text{net available}} = 125 - (5 + 0,68 + 2,93 + 0,2334) = 123,84$ m

When comparing this value with the design value (not taking into account the dynamic energy) we see that $123,84$ m > 105 m [$P_{\text{net available}} > P_{\text{required}}$]

The set is therefore capable of meeting system requirements.

GS20, GS30 SERIES

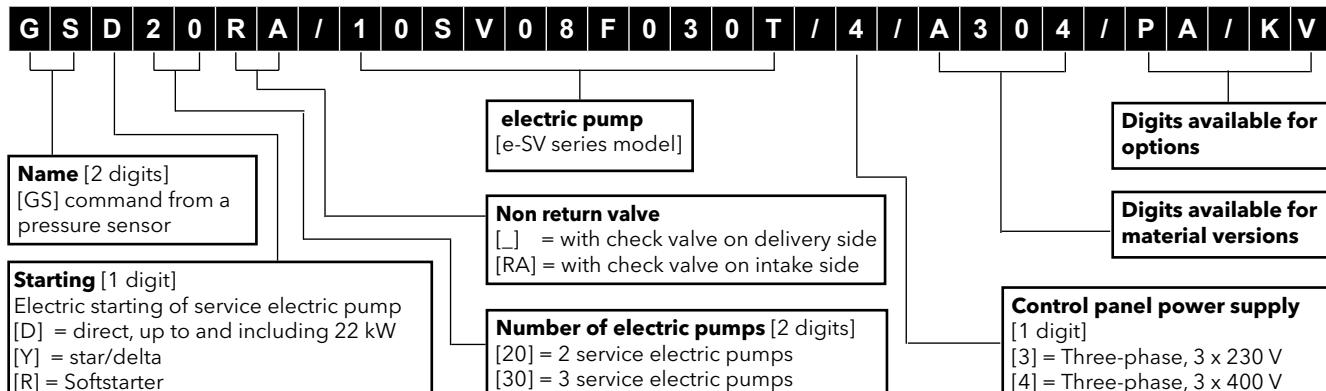

Fixed speed booster sets

e-SV series multistage vertical electric pumps

Electrical motor power up to 37 kW

Flow rates up to 480 m³/h and pressures up to 16 bar

GS BOOSTER SETS SERIES IDENTIFICATION CODE

MATERIAL VERSIONS

- A304 Main components in contact with the liquid in AISI 304 stainless steel or higher.
Galvanised screws and bolts. Flanges not in contact with the liquid galvanised.
- B304 Main components in contact with the liquid in AISI 304 stainless steel or higher. Screws and bolts in AISI 304 stainless steel or higher. Flanges not in contact with the liquid in AISI 304 stainless steel.
- C304 Main components in contact with the liquid in AISI 304 stainless steel or higher. Base, brackets, supports, screws and bolts in AISI 304 stainless steel or higher. Flanges not in contact with the liquid in AISI 304 stainless steel or higher.
Valves fully made of AISI 304 stainless steel or higher (body, heads, disc).
- A316 Main components in contact with the liquid in AISI 316 stainless steel or higher. Galvanised screws and bolts.
Flanges not in contact with the liquid galvanised.
- B316 Main components in contact with the liquid in AISI 316 stainless steel. Screws and bolts in AISI 316 stainless steel.
Flanges not in contact with the liquid in AISI 316 stainless steel.
- C316 Main components in contact with the liquid in AISI 316 stainless steel. Base, brackets, supports, screws and bolts in AISI 316 stainless steel. Flanges not in contact with the liquid in AISI 316 stainless steel.
Valves fully made of AISI 316 stainless steel (body, heads, disc).

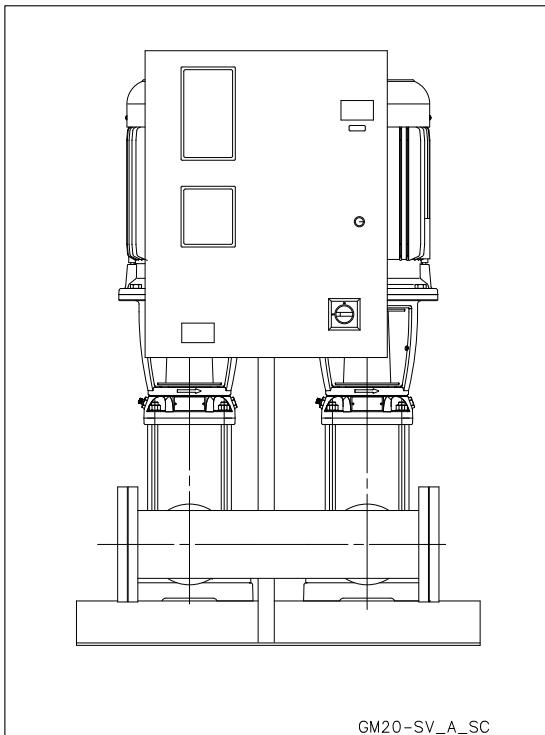

OPTIONS

- 3A Booster set with electric pump certified 1A (Factory test reports includes QH curve).
- 3B Booster set with electric pump certified 1B (Test report includes QH curve, efficiency and power).
- 60 60 Hz frequency voltage supply for booster.
- BAP High pressure switch mounted on delivery manifold.
- C9 Turned up discharge manifold, elbow, no membrane vessel on discharge manifold.
- CI Control panel with engines isolation control.
- CM Suction manifold or delivery manifold oversized.
- CP Dry contacts: power, automatic/manual, run/stop for each electric pump, thermal overload, low level alarm, minimum/maximum pressure alarm, external alarm.
- DR1 Booster set with 1 optical level switch for the control of the liquid presence/absence, fixed on to suction manifold; set with special control panel.
- FY Y filters placed on suction of each electric pump.
- IP65 Control panel IP65.
- PA Minimum pressure switch mounted on suction manifold and connected to lack of water input.
- PE Emergency shut-off pushbutton.
- PMA Vacuum pressure gauge and minimum pressure switch connected to lack of water input, both mounted on suction manifold.
- PP Booster with pressure switch instead pressure transmitters.
- PQ Booster set with high suction pressure (pressure gauge/pressure switches/pressure transmitter increased of one range)
- RE Heaters inside the control panel, with thermostat.
- RV Control panel with phase sequence, phase loss, over- and undervoltage and phase unbalance.
- SA Without suction: without valves on suction and without suction manifold.
- SC Booster set without pressure switches or transmitter, pressure gauge is mounted.
- SCA Without suction manifold (valves are mounted).
- SCM Without delivery manifold (without pressure switches, transmitter and pressure gauge, valves are mounted).
- SM Without delivery: without valves on delivery and without delivery manifold.
- SQ Without control panel and without panel frame, switches or transmitters are present.
- SQC Without control panel and without panel frame, switches or transmitters aren't present.
- SR Without non return valve.
- TS Booster set with electric pumps equipped with special mechanical seals.
- VA Control panel with digitals voltmeter and ammeter.
- WM Control panel wall mounting version. Cable length 5 m

Some options are not feasible concurrently. Please contact the Sales and Technical Assistance Service.

GS BOOSTER SETS SERIES RANGE

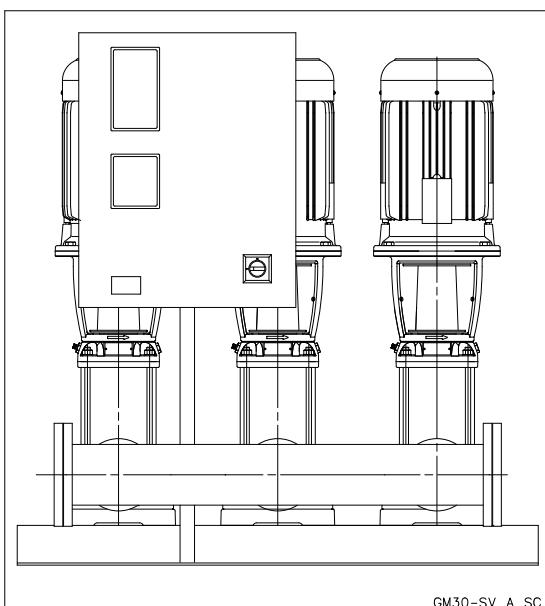

The standard range of GS series fixed-speed booster sets includes models with 2 and 3 electric pumps in different configurations, to adapt to the specific needs of each application.

GS20 SETS

Fixed-speed sets with two multistage vertical service electric pumps, SV series, with power ratings up to 37 kW.

Head up to 160m.
Flow rate up to 320 m³/h.

GS30 SETS

Fixed-speed sets with three multistage vertical service electric pumps, SV series, with power ratings up to 37 kW.

Head up to 160m.
Flow rate up to 480 m³/h.

ELECTRIC PUMPS GENERAL DESCRIPTION

The **e-SV** electric pump is a multistage vertical electric pump, not self-priming, combined with a normalised standard motor.

The liquid end, located between the upper cover end the electric pump casing, is held in place by tie rods. The electric pump casing is available with different configurations and connection types.

Technical Information:

Flow rates: up to 160 m³/h.

Heads: up to 160 m.

(referred to the electric pump range used in this catalogue).

Temperature of electric pumped liquid:
from -30°C to +120°C (standard version).

Tested to ISO 9906:2012 - Grade 3B
(ex ISO 9906:1999 - annex A).

Direction of rotation: clockwise looking at the electric pump from the top down (indicated with an arrow on the bracket and joint).

Mechanical seal: Silicon carbide/Carbon/EPDM.
e-SV electric pumps (only for 10, 15, 22SV ≥ 5,5 kW and 33, 46, 66, 92, 125SV) are fitted standard with a balanced mechanical seal that can be replaced without having to remove the motor from the electric pump.

Elastomers: EPDM.

Motor

Supplied IE3 three-phase surface motors ≥ 0,75 kW as standard.

Electrical performances according to EN 60034-1.

Insulation class 155 (F).

IP55 protection.

Condensate drain plugs on standard version.

Cooling by fan according to EN 60034-6.

Cable gland metric size according to EN 50262.

Standard supplied e-SV electric pumps are equipped with Standard motors.

Standard voltage:

• **Three-phase version:** 220-240/380-415 V or 380-415/660-690 V 50 Hz.

For electrical data of the motors used see page 18 and 19.

Materials

The electric pumps for F, T, R, N, G versions are certified for drinking water use (**WRAS** and **ACS** certified).

For complete information see dedicated e-SV technical catalogue.

ELECTRIC PUMPS

3, 5, 10, 15, 22SV SERIES CHARACTERISTICS

- Multistage centrifugal vertical electric pumps. All metal parts in contact with electric pumped liquid are made of stainless steel.
- **F** version: round flanges, in-line delivery and suction ports, AISI 304 stainless steel.
- Further choice possibilities among the following versions:
 - **T**: oval flanges, in-line delivery and suction ports, AISI 304 stainless steel.
 - **R**: round flanges, delivery port above the suction port and adjustable in four positions, AISI 304 stainless steel.
 - **N**: round flanges, in-line delivery and suction ports, AISI 316 stainless steel.
- Reduced axial thrusts enable the use of **standard motors** that are easily found on the market.

- Standard mechanical seal according to EN 12756 (formerly DIN 24960) and ISO 3069 for series 1, 3, 5SV and 10, 15, 22SV ($\leq di 4 \text{ kW}$).
- **Balanced mechanical seal** according to EN 12756 (formerly DIN 24960) and ISO 3069, easy to replace **without removing the electric pump motor**, for series 10, 15 and 22SV ($\geq di 5,5 \text{ kW}$).
- Seal housing designed to avoid air accumulation inside the critical area adjoining the mechanical seal.
- Second loading plug available for series 10, 15, 22SV.
- Easy maintenance. No special tools required for assembly or disassembly.

F, T, R and N electric pumps are certified for use with drinking water (WRAS and ACS)

33, 46, 66, 92, 125SV SERIES CHARACTERISTICS

- Version **G**: Multistage vertical centrifugal electric pump with impellers, diffusers and outer jacket fully made of stainless steel; superior cast iron electric pump body and head.
Round flanges, in-line delivery and suction ports.
- Further choice possibilities among the following versions:
 - **N, P**: fully made of AISI 316 stainless steel.
- In electric pumps with higher heads, the axial load compensation system allows a reduction of axial thrusts, and therefore the use of **normalised standard motors**, easy to find on the market.
- **Balanced mechanical seal** according to EN 12756 (formerly DIN 24960) and ISO 3069, **easy to replace without removing the electric pump motor**.

- Seal housing designed to avoid air accumulation inside the critical area adjoining the mechanical seal.
- Electric pump body supplied with the necessary attachments for a pressure gauge on the flanges, both on the suction and the delivery side.
- Mechanical strength and easy maintenance. No special tools required for assembly or disassembly.

G and N electric pumps are certified for use with drinking water (WRAS and ACS)

ELECTRIC PUMPS WORKING LIMITS

Liquids handled	Water containing no gas or corrosive and/or aggressive substances.
Fluid temperature	Above -10°C a + 80 °C
Ambient temperature	Above 0°C a + 40 °C
Maximum operating pressure	Max 8 bar, 10 bar, 16 bar in function of pump type
Minimum inlet pressure	According to NPSH curve and losses, with a minimum margin of 0.5 m
Maximum inlet pressure	The inlet pressure added to the pressure of the pump at zero flow must be lower than the maximum operating pressure of the set.
Installation	Indoors, protected from the weather. Away from heat sources. Max elevation 1000 m ASL. Max humidity 50% without condensation.
Hourly starts (single pump)	0,25 kW ≤ Pn ≤ 3 kW max 60 starts per hour. Direct motor start; 4 kW ≤ Pn ≤ kW max 40 starts per hour. Direct motor start; 11 kW ≤ Pn ≤ kW max 30 starts per hour. Direct motor start; 18,5 kW ≤ Pn ≤ 22 kW max 24 starts per hour. Direct motor start; 30 kW ≤ Pn ≤ 37 kW max 16 starts per hour. Start/delta start; Pn = 45 kW max 8 starts per hour. Start/delta start;
Sound emission	See table

* On request, PN above in function of the pump

gfix_2p-en_c_it

GS BOOSTER SETS SERIES CONTROL PANEL FOR GS20, GS30

Electric panel for powering, controlling and protecting two or three electric pumps, protected to IP55, metal case. IP65 protection grade is an option (GS../IP65).

Main characteristics:

- General doorlock switch, fuse holders and fuses, starting contactors and circuit breakers.
- Standard input voltage: 3x400Vca +/-10%, 50/60Hz. Non-standard voltages available on request, 1x230Vac +/-10%, 3x230ca +/-10%, 50/60Hz.
- Transformer for auxiliary low voltage circuit; auxiliary voltage 24Vac.
- SM30 digital microprocessor-controlled control unit with LCD display and programming keyboard (see fig. 2), featuring the following functions:

- Indicator lamps: power on (ref.1), general fault (ref.2), no water alarm (ref.3), electric pump running (ref.4);
- Programming keyboard (ref.5);

- Manual electric pump stop/start (one button for each electric pump) (ref.5);

- Automatic cascade electric pump control with two electronic pressure transmitters. If a sensor develops a fault, the board automatically switches to the second sensor. Pressure switch control available on request.

- Jockey electric pump management on request.

- Cycle reversal function (can be disabled). Automatically switches electric pumps after every start/stop cycle.

- Automatic, manual or disabled mode switches for each pump (inside the board).

- Periodic system self-test with an electrovalve command which opens the hydraulic circuit, simulates a pressure drop and consequently activates the control devices (pressure switches and pressure transmitters). electric pump diagnostics.

- No-water protection system alternatives: float, minimum pressure switch, external contact or electrode probes with sensitivity adjustment.

- Adjustable timer delaying tripping the no-water protection system.

- Adjustable timer delaying starting of each electric pump.

- Adjustable timer extending the operation of each electric pump.

- System pressure drop offset function, only available with pressure sensor.

- Adjustable analogue output, 0(4)-20mA or 0-2(10)Vdc, for visualising the analogue input signal.

fig. 1

GS

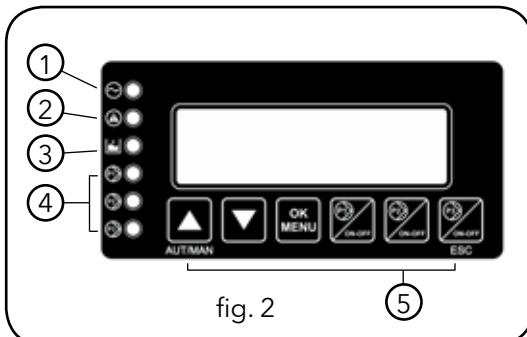

fig. 2

GS BOOSTER SETS SERIES

CONTROL PANEL FOR GS20, GS30

- Configurable relay with volt-free contact, delayed activation, signalling the following conditions:
 - Motor overload protection alarm.
 - No-water circuit alarm.
 - Pressure sensor fault.
 - Out-of-curve operation alarms (only if self-test is disabled).
 - Maximum intake pressure alarm.
 - Electrovalve opening permission for self-test circuit.
- Configurable digital inputs.
 - AUX1 input configuration, maximum pressure switch or external self-test.
 - AUX2 input configuration, permission from external device (NO) or external alarm (NC).
 - AUX3 input configuration, change set (NO) or pressure switch operating out-of-curve.
- 12Vdc output for powering the acoustic alarm.
- Alarms log and hour counters for each installed electric pump. Alarms visualised on display:
 - Maximum, minimum pressure;
 - Circuit breaker for each motor;
 - Pressure transmitter fault.
 - Out-of-curve operation;
 - No water;
 - Block for tripped external device (e.g overvoltage/undervoltage, or thermal overload, etc.)
 - Auto-test failedAll the alarms light the Fault lamp (ref.2 - fig.2)
The no-water alarm lights the Level alarm lamp (ref.3 - fig.2)
- Standard, RS485 serial communication, slave, and ModBus RTU protocol.
- A relay board (optional) can be connected to boost the following signals: electric pump running, aut-man mode for each electric pump, overload alarm, no-water alarm, maximum/minimum pressure alarm, power on, self-test failed. The optional signal booster board has six relays, each of which can be configured using the SM30 control unit.

For booster sets requiring a wall mounted control panel (GS.../WM), the panel is supplied with 5 metre cables.

Other options available:

- GS.../CP
- GS.../PA
- GS.../60

See the option description on page 14.

GS BOOSTER SETS SERIES

MAIN COMPONENTS

- **Main On-off valves** on suction and discharge side of each electric pump, ball type with threaded coupling up to 2" size included. Butterfly type for installation between the flanges are used for larger diameters.
- **Check valve** on discharge side of each electric pump, spring-loaded type, with threaded coupling up to 2" size, as well as the double-swing type to fit between the flanges.
- **Suction manifold** with threaded or flanged ends depending on the type of electric pump (see drawings). Threaded coupling for water charging.
- **Delivery manifold** with threaded or flanged ends depending on the type of electric pump (see drawings). Fitted with two R1" threaded couplings with caps to allow connection of diaphragm pressure vessels.
- **Pressure gauge and 2 control transmitters** located on the delivery manifold of the unit.
- **Electric control panel**, IP55 protection class.
- **Various couplings** for the connections.
- **Mounting base**, for electric pumpset and panel mounting brackets.
- **Anti-vibration dampers** sized depending on the set. In some sets they are provided but not assembled. The installation is the responsibility of the customer.

VERSIONS AVAILABLE

Manifolds, valves, flanges, base and main components made of AISI 304 or AISI 316 stainless steel; versions:

GHV.../A304, GHV.../B304, GHV.../C304,
GHV.../A316, GHV.../B316, GHV.../C316

Accessories on request:

- Devices for **protection against dry running** in one of the following versions:
 - float switch;
 - pack of electronic module and probe electrodes;
 - minimum pressure switch.

• **Diaphragm expansion vessel kit**

Hydrotube with on-off valve, depending on the maximum head of the electric pump::

- 24 lt, 8 bar hydro tube kit
- 24 lt, 10 bar hydro tube kit
- 24 lt, 16 bar hydro tube kit
- 20 lt, 25 bar hydro tube kit

SPECIAL VERSIONS AVAILABLE ON REQUEST (Contact the Sales and technical Assistance Service)

- Units with non-standard input voltages, such as three-phase 3x230V, 3x440V.
- Units with single-phase input voltages 1x230V.
- Units with 4-5 service electric pumps (GS40...GS50...).
- Units with 2-3-4 service electric pumps and jockey electric pump (GS21... GS31... GS41...).
- Units with stainless steel expansion vessels.
- Units with special valves.

WORKING LIMITS

The input pressure of the electric pump, added to the pressure with the port shut off, must not exceed the maximum permitted operating pressure (PN) of the set.

Permitted liquids	Water without gases and corrosive and/or aggressive substances.
Fluid temperature	-10°C to + 80 °C
Ambient temperature	0°C to + 40 °C
Maximum operating pressure*	Max 16 bar
Minimum input pressure	In line with the NPSH curve and the losses, with a margin of at least 0,5 m
Maximum input pressure	The input pressure added to the pump pressure without flow must be lower than the maximum operating pressure of the set.
Installation	Internal environment protected from atmospheric agents. Away from heat sources. Max altitude 1000 a.s.l. Max humidity 50%, without condensation.
Sound emission	See table

* Higher PN available on request depending on pump type

Booster sets

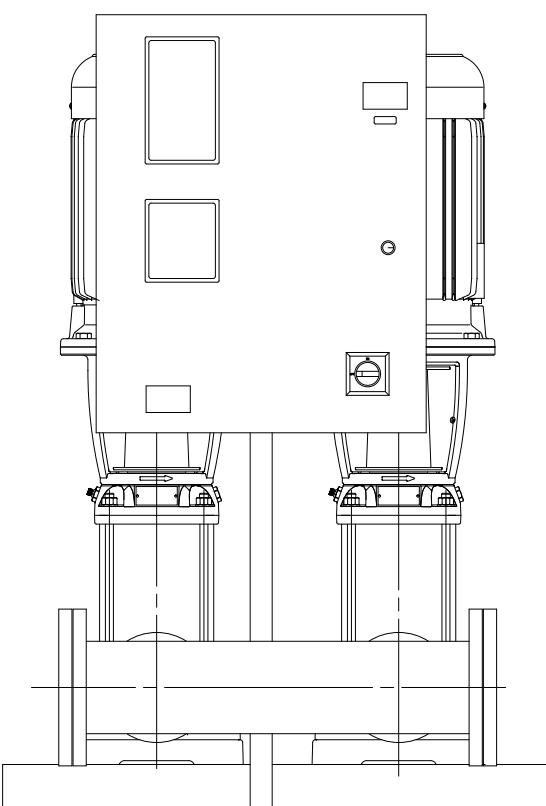

MARKET SECTORS

RESIDENTIAL-CIVIL, INDUSTRIAL

APPLICATIONS

- Water network supply in housing complexes, offices, hotels, shopping centres, industrial plants.
- Supply of water networks for agricultural applications (e.g. irrigation).

GSD20 - GSY20 Series

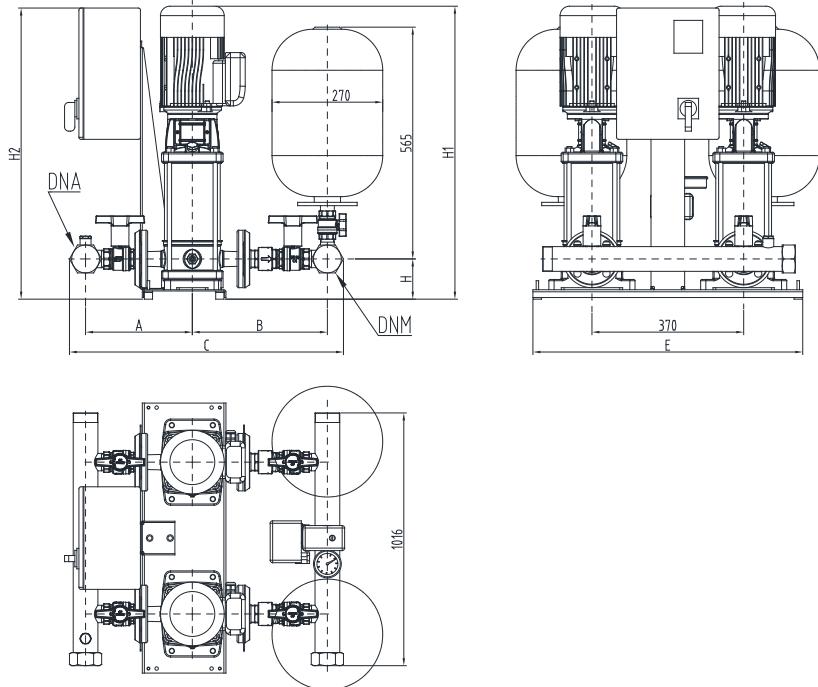

GM20-SV_A_SC

SPECIFICATIONS

- **Flow rate** up to 320 m³/h.
- **Head** up to 160 m.
- Electrical panel supply voltage: 3 x 400V ± 10%.
- Frequency 50 Hz.
- Voltage for controls outside panel: 24 Vac.
- Electrical panel protection class IP 55.
- Vertical electric pumps e-SV
- Maximum service electric pump power: 2 x 37 kW.
- Motor start-up:
 - Direct for powers up to 22 kW inclusive for electric pump (GSD/).
 - Star/Delta for higher powers (GSY/ set).
 - Softstarter, available on request (GSSF/ set).
- **Electric pumps with vertical axis:**
 - SV series (motor protection class IP55).
- Maximum operating pressure: 16 bar.
- Maximum temperature of electric pumped liquid: +80°C.

GS series booster sets with e-SV series electric pumps are certified for use with drinking water.

MARKET SECTORS

RESIDENTIAL-CIVIL, INDUSTRIAL

APPLICATIONS

- Water network supply in housing complexes, offices, hotels, shopping centres, industrial plants.
- Supply of water networks for agricultural applications (e.g. irrigation).

GSD30 - GSY30 Series

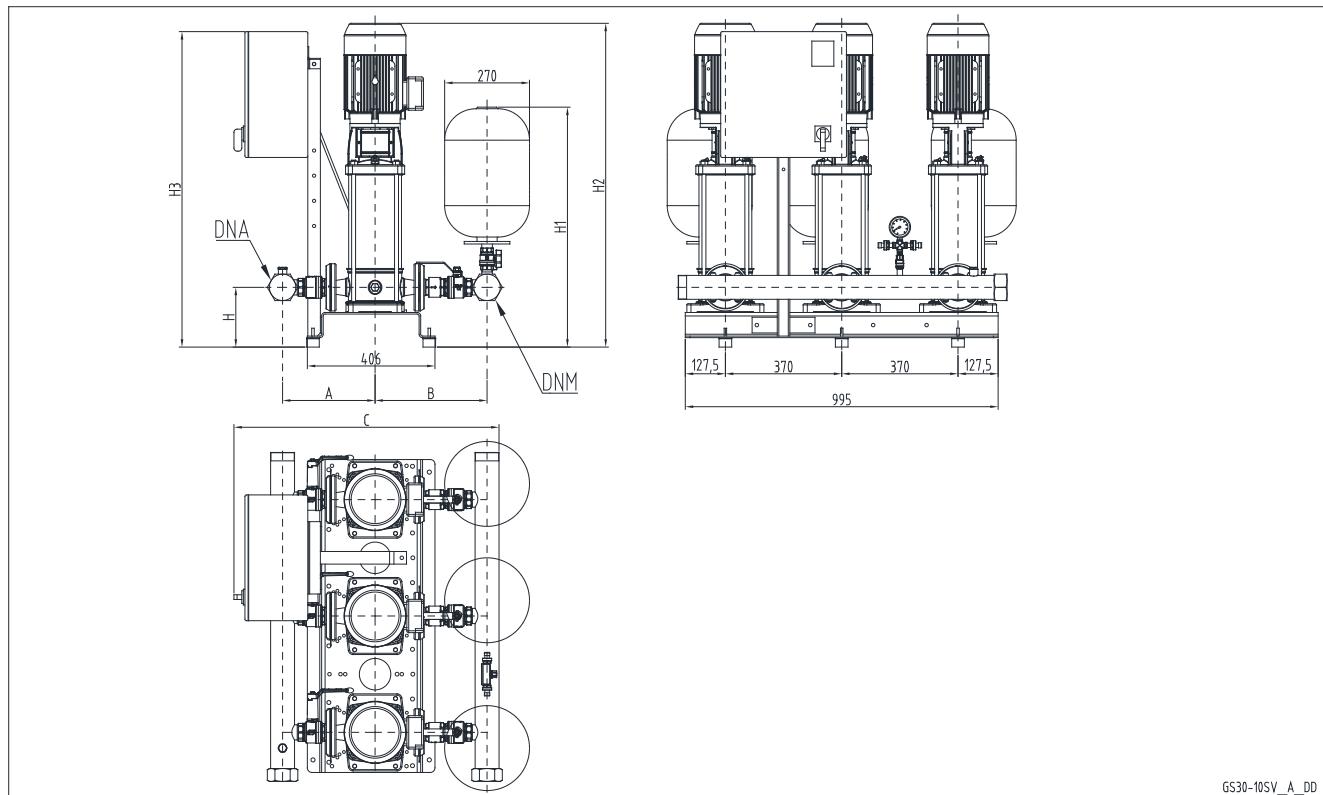

SPECIFICATIONS

- **Flow rate** up to 480 m³/h.
- **Head** up to 160 m.
- Electrical panel supply voltage: 3 x 400V ± 10%.
- Frequency 50 Hz.
- Voltage for controls outside panel: 24 Vac.
- Electrical panel protection class IP 55.
Vertical electric pumps e-SV
- Maximum service electric pump power: 3 x 37 kW.
- Motor start-up:
 - Direct for powers up to 22 kW inclusive for electric pump (GSD/).
 - Star/Delta for higher powers (GSY/ set).
 - Softstarter, available on request (GSSF/ set).
- **Electric pumps with vertical axis:**
 - SV series (motor protection class IP55).
- Maximum operating pressure: 16 bar.
- Maximum temperature of electric pumped liquid: +80°C.

GS series booster sets with e-SV series electric pumps are certified for use with drinking water.

PERFORMANCE CURVES

GS.../SV BOOSTER SETS SERIES
OPERATING CHARACTERISTICS AT 50 Hz (SERVICE)

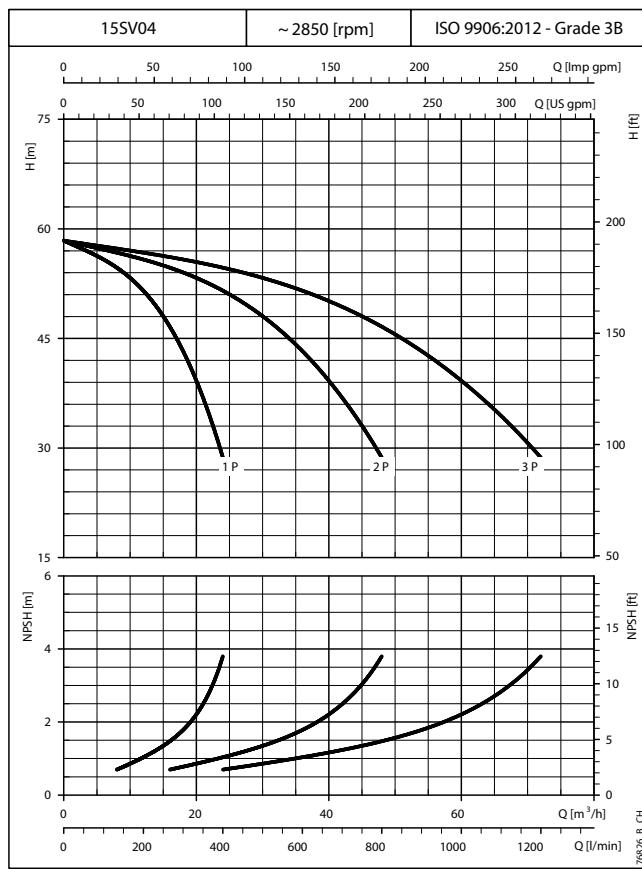

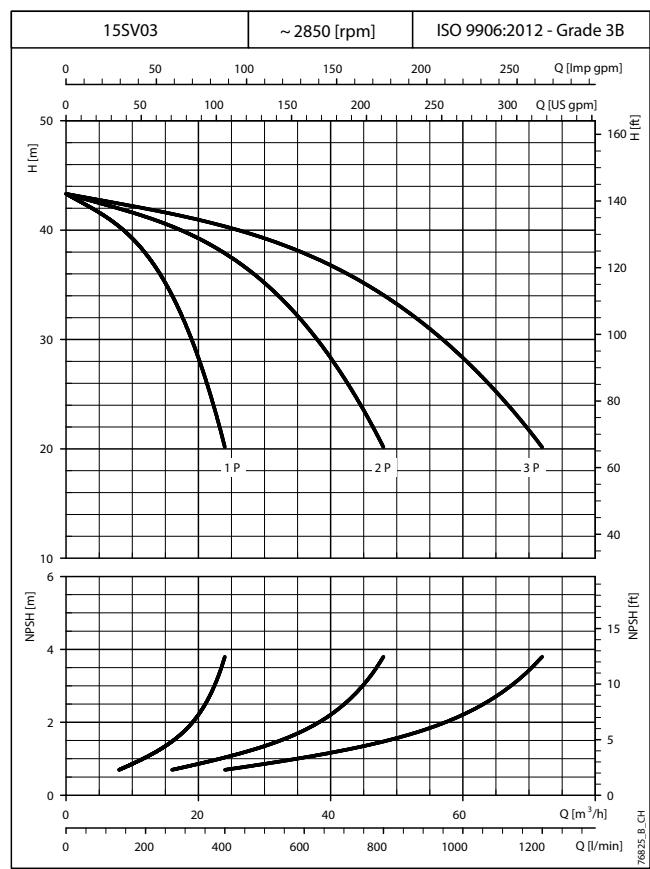

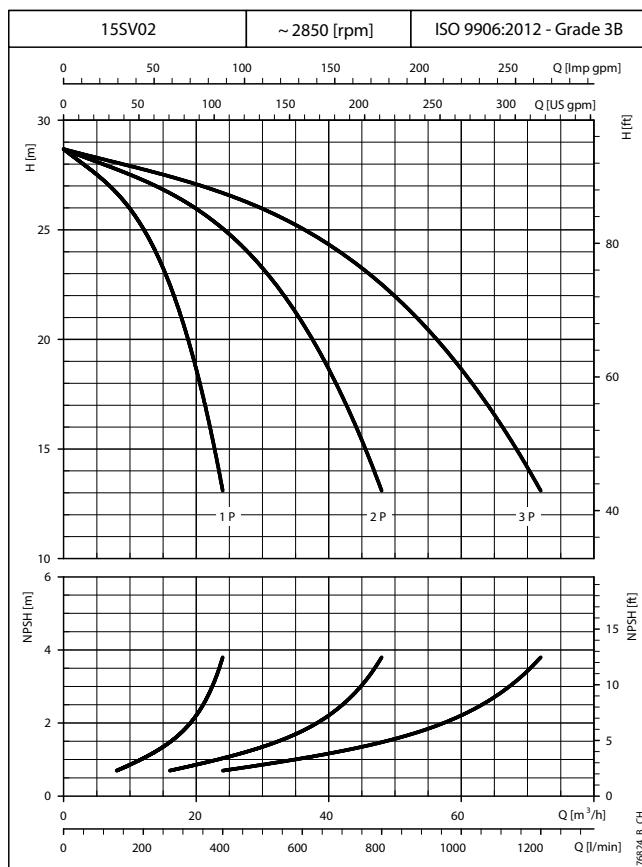

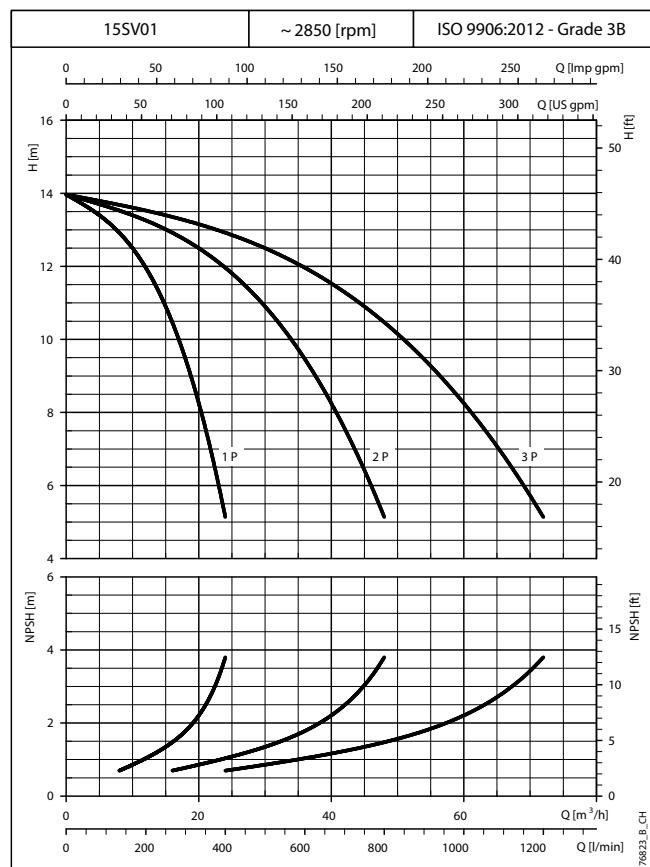

The performance curves do not take into account flow resistance in the valves and piping. The curves show the performance with one, two and three electric pumps running. These performances are valid for liquids with density $\rho = 1.0 \text{ Kg/dm}^3$ and kinematic viscosity $v = 1 \text{ mm}^2/\text{sec}$.
The declared NPSH values are laboratory values; for practical use we recommend increasing these values by 0,5 m.

The performance curves do not take into account flow resistance in the valves and piping. The curves show the performance with one, two and three electric pumps running. These performances are valid for liquids with density $\rho = 1.0 \text{ Kg/dm}^3$ and kinematic viscosity $v = 1 \text{ mm}^2/\text{sec}$.
The declared NPSH values are laboratory values; for practical use we recommend increasing these values by 0,5 m.

ACCESSORIES

DIAPHRAGM EXPANSION VESSELS

Booster sets have delivery manifolds with attachments for the installation of 8 or 24 litre diaphragm expansion vessels (hydrotube).

The caps for sealing any unused attachments are supplied with the set.

Any large size vessels can be connected to the unused end of the delivery manifold. For proper sizing of the vessel, please refer to the technical appendix.

Kits featuring the following accessories are **available on request**:

- expansion vessel.
- on-off valve.
- instructions sheet.
- packing.

FLANGE KIT

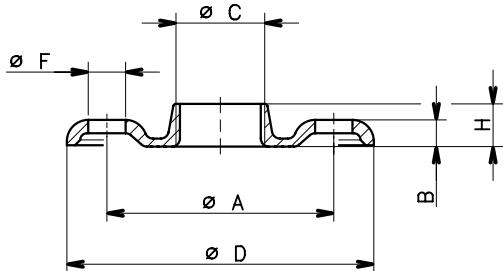

Manifolds up to 3" in diameter are usually supplied with threaded couplings and caps on unused end.

For these manifolds, stainless steel AISI 304 or 316 flanges for connection to the system are available on request.

ANTI-VIBRATION JOINT KIT

Anti-vibration joints, or compensation joints, can be used to absorb deformations, expansions, pipe noise and reduce water hammering. They can also withstand a high level of vacuum, which enables the absorption of negative expansions due to depression.

Due to its elasticity, the material can deform or expand as necessary, making installation easier, simpler and quicker, even when the piping is not aligned.

The certificate for drinking water is valid for the standard configuration, without joint.

The certification could be voided if the booster was sent, on request, complete with fitted joints.

For more information, please contact the sales network.

PROTECTION SYSTEMS AGAINST DRY RUNNING

To avoid damaging the electric pumps, protection systems must be used to prevent it from dry running.

FLOAT SWITCH PROTECTION

The float switch system is used for supplies from open tanks. The float switch immersed in the tank must be connected to the control panel.

If there is no water, the float switch opens the electrical contact and the electric pumps stop.

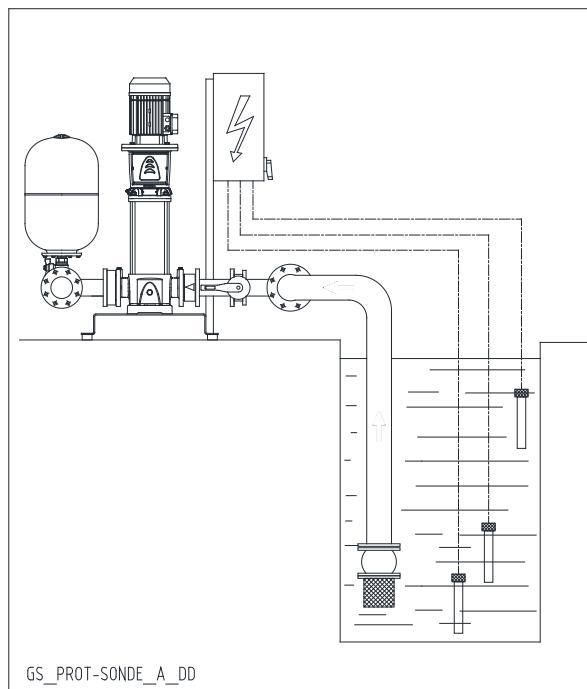

ELECTRODE PROBE PROTECTION

The system with electrode probes is used for supplies from open tanks or wells.

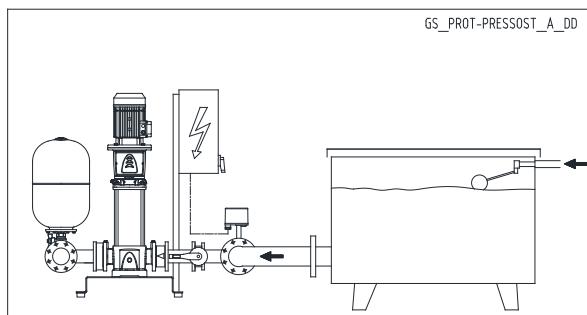

Three probes are directly connected to the electric module with adjustable sensitivity that can be installed in the control panel.

If there is no water, the control circuit opens the electrical contact and the electric pumps stop.

MINIMUM PRESSURE SWITCH PROTECTION

The system with minimum pressure switch is used for water supplies from pressurised networks or tanks. The pressure switch is connected to the control panel. In case of water shortage, it opens the electric contact, causing the stop of the electric pumps.

PROTECTION SENSOR AGAINST DRY RUNNING

Sensor for detecting the presence of water based on the optoelectronic principle, therefore non-invasive and with no moving parts. The sensor features an electronic contact (on/off) which stops the pump if there is no water in the seal area.

The sensor opens the electric contact if there is no water after they factory-set delay (10 seconds) elapses. The sensor is supplied as a kit complete with 2 metres of cable, an EPDM O-ring gasket and a stainless steel adapter.

General operating featuresgo

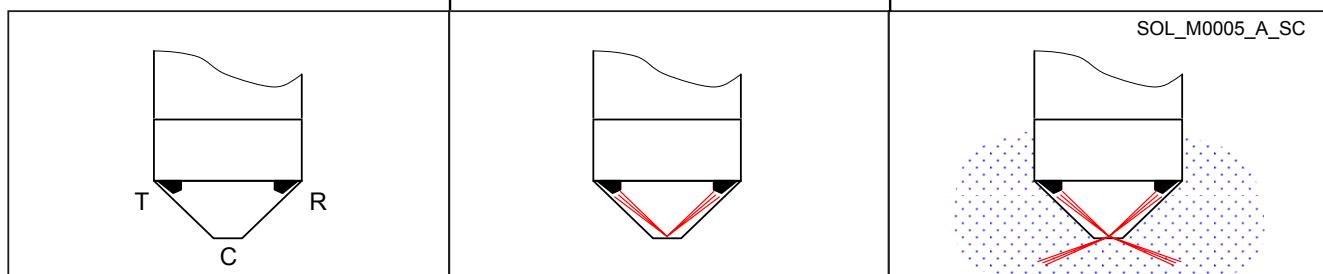

- SENSOR KIT DRP-GP: 21÷27 Vca:** In the boosters sets the sensor is assembled on the suction manifold with a specific hydraulic fitting.
21÷27 Vca version, universal solid state output for external relay at 24 Vac (21÷27 Vac, 50 mA).
- KIT SENSOR DRP-HV: 15÷25 Vcc:** The sensor can also be fitted directly on the filling cap of the e-SV pumps series. 15÷25 Vcc version, NPN output at 25 V (10 mA) for HYDROVAR inverter and e-SM drive.
- Operation is independent of the hardness and conductivity of the water. The sensor cannot detect frozen liquids.

Operating principle

Operation is based on the change in the refractive index on the surfaces. The optic sensor comprises a glass cap (C) containing a transmitter (T) and an infrared receiver (R).

If there is no liquid, all the infrared light emitted by the transmitter is internally reflected by the surface of the glass cap of the receiver. The electronic contact will be open.

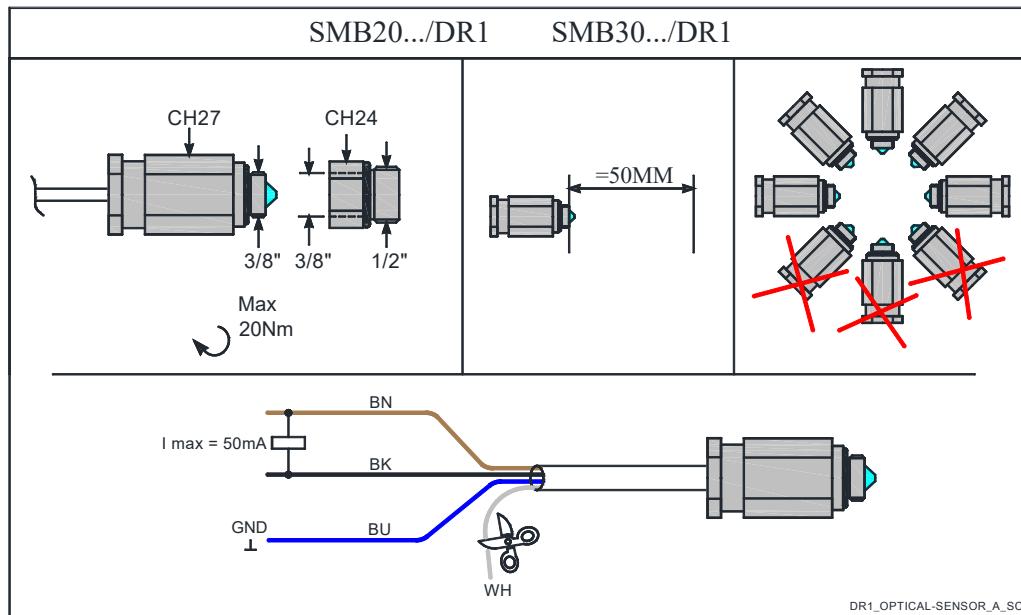

If liquid is present, the refractive index of the surface changes. Most of the infrared light emitted by the transmitter is dispersed in the liquid. The receiver receives less light and the electronic contact is closed.

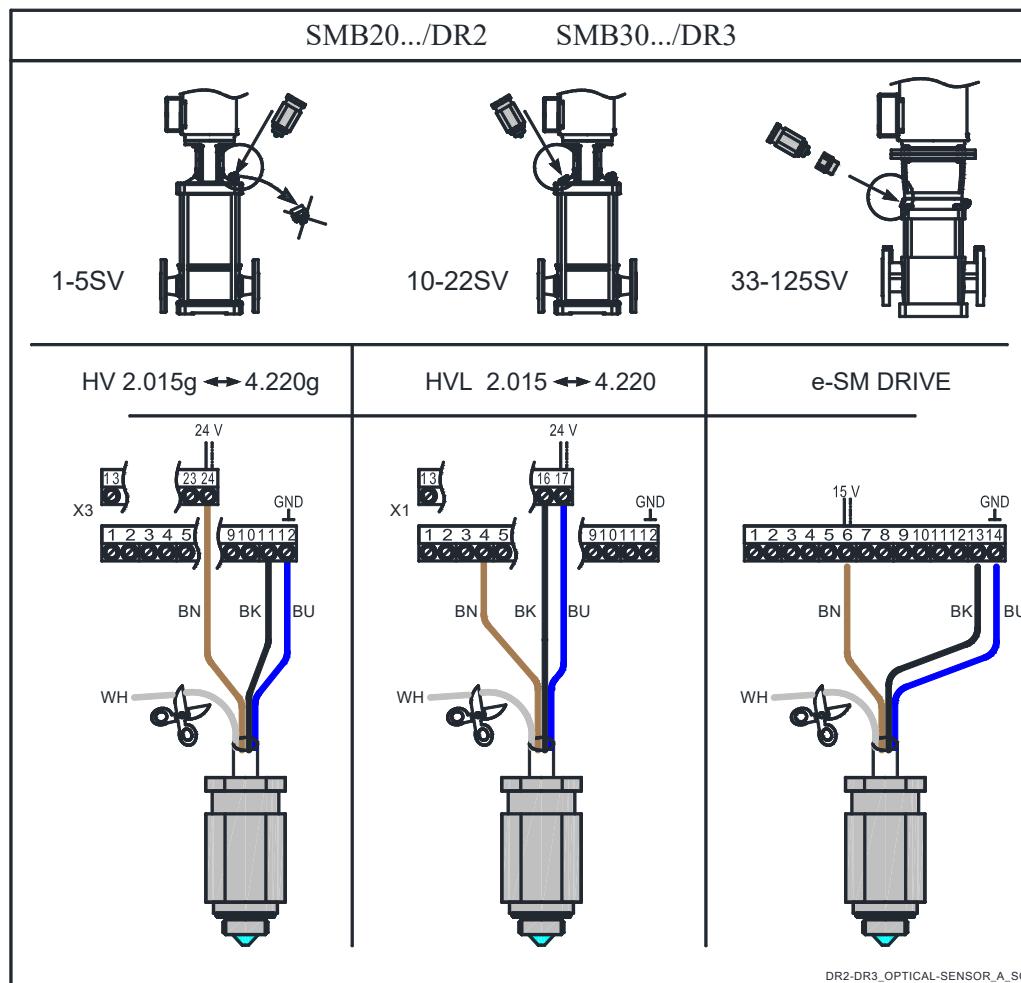

SPECIFICATIONS

- Materials:
 - Body in AISI 316L stainless steel
 - Glass optic cap
 - EPDM gasket
- Liquids: clean water, demi water. Operation is not affected by the hardness and conductivity of the liquid. To check the suitability of other liquids, contact the Lowara technical assistance service providing the characteristics of the liquid.
- Temperature of liquid: -20°C÷+120°C (cannot be used to detect frozen liquids).
- Ambient temperature: -5°C ÷+50°C
- Maximum pressure (PN): 25 bar
- Connector: 3/8 " (3/8" x 1/2" adaptor plug included in the Kit)
- Dimensions: 27x 60 mm
- IP55 protection
- Electrical characteristics:
 - Input voltage SENSOR KIT DRP-GP: 21÷27 Vac
SENSOR KIT DRP-HV: 15÷25 Vdc
 - Output SENSOR KIT DRP-GP: universal solid state 21÷27 Vac (50 mA) for 24 Vac external relay
SENSOR KIT DRP-HV: NPN 25 V (10 mA) for HYDROVAR inverter
 - Alarm delay: 10 seconds (factory setting)
 - FROR cable 4 x 0,34 mm²(PVC-CEI 20-22) 2 metres long.

WIRING DIAGRAM

SENSOR KIT DRP-GP (code 109394610)

SENSOR KIT DRP-HV (code 109394600)

The sensor can be directly mounted on the filling plug of the e-SV pumps.
For the 33, 46, 66, 92, 125SV series, the 3/8" x 1/2" adaptor ring included in the Kit must also be mounted.

hr = flow resistance for 100 m of straight pipeline (m)

G-at-pct-en_b_th

V = water speed (m/s)

FLOW RESISTANCE

TABLE OF FLOW RESISTANCE IN BENDS, VALVES AND GATES

The flow resistance is calculated using the equivalent pipeline length method according to the table below:

ACCESSORY TYPE	DN											
	25	32	40	50	65	80	100	125	150	200	250	300
	Equivalent pipeline length (m)											
45° bend	0,2	0,2	0,4	0,4	0,6	0,6	0,9	1,1	1,5	1,9	2,4	2,8
90° bend	0,4	0,6	0,9	1,1	1,3	1,5	2,1	2,6	3,0	3,9	4,7	5,8
90° smooth bend	0,4	0,4	0,4	0,6	0,9	1,1	1,3	1,7	1,9	2,8	3,4	3,9
Union tee or cross	1,1	1,3	1,7	2,1	2,6	3,2	4,3	5,3	6,4	7,5	10,7	12,8
Gate valve	-	-	-	0,2	0,2	0,2	0,4	0,4	0,6	0,9	1,1	1,3
Foot check valve	1,1	1,5	1,9	2,4	3,0	3,4	4,7	5,9	7,4	9,6	11,8	13,9
Non return valve	1,1	1,5	1,9	2,4	3,0	3,4	4,7	5,9	7,4	9,6	11,8	13,9

G-a-pcv-en_b_th

The table is valid for the Hazen Williams coefficient C=100 (cast iron pipework)

for galvanized steel or painted steel multiply the values by 0,71;

for stainless steel and copper multiply the values by 0,54;

for Pvc and PE multiply the values by 0,47.

When the **equivalent pipeline length** has been determined, the flow resistance is obtained from the table in the previous page.

The values given are guideline values which are bound to vary slightly according to the model, especially for gate valves and non-return valves, for which it is a good idea to check the values supplied by manufacturers.

TANK

CHOOSING AND SIZING THE SURGE TANK

The purpose of the surge tank is to limit the number of hourly starts of the electric pumps, placing part of its stock of water, which is maintained under pressure by the air above it, at the disposal of the system.

The surge tank can be of the air cushion or diaphragm type.

In the air cushion version there is no clear separation between air and water.

Since part of the air tends to mix with water, it is necessary to restore it by means of air supply units or a compressor.

In the diaphragm version, neither air supply units nor compressor are needed, as contact between air and water is prevented by a flexible diaphragm inside the tank.

The following method, which is used to determine the volume of a surge tank, is valid both for horizontal and vertical surge tanks.

When calculating the volume of the surge tank, it is generally sufficient to consider the first electric pump only.

DIAPHRAGM TANK

If you decide to use a diaphragm tank, the volume will be lower than that of the air-cushion tank. It can be calculated with the following formula:

$$V_m = \frac{Q_p}{4 \times Z} \times \frac{1}{1 - \frac{(P_{min} - 2)}{P_{max}}}$$

where:

V_m = Total volume of the air-cushion surge tank in m^3

Q_p = Average electric pump flow rate in m^3/h

P_{max} = Maximum pressure setting (wcm)

P_{min} = Minimum pressure setting (wcm)

Z = Maximum number of starts per hour allowed by the motor

Example:

22SV10F110T electric pump

$P_{max} = 23$ wcm

$P_{min} = 15$ wcm

$Q_p = 20$ m^3/h

$Z = 25$

$$V_m = \frac{Q_p}{4 \times Z} \times \frac{1}{1 - \frac{(P_{min} - 2)}{P_{max}}} = 0,46 \text{ } m^3$$

A 500-litre surge tank is therefore required.

FURTHER PRODUCT SELECTION AND DOCUMENTATION

Xylect

Xylect is electric pump solution selection software with an extensive online database of product information across the entire Lowara range of electric pumps and related products, with multiple search options and helpful project management facilities. The system holds up-to-date product information on thousands of products and accessories.

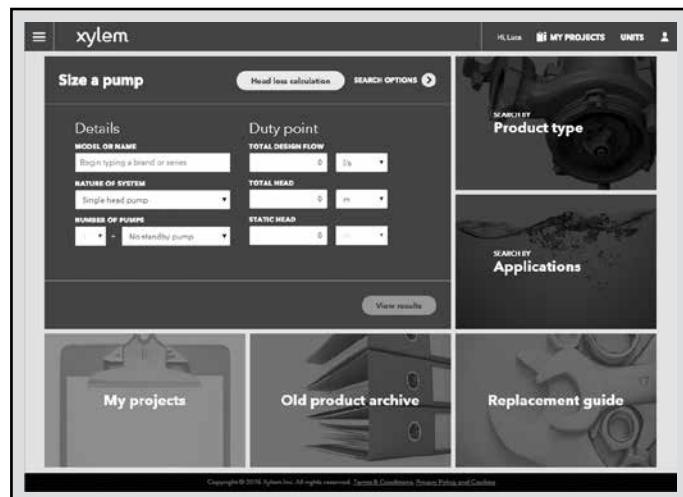

The possibility to search by applications and the detailed information output given makes it easy to make the optimal selection without having detailed knowledge about the Lowara products.

The search can be made by:

- Application
- Product type
- Duty point

Xylect gives a detailed output:

- List with search results
- Performance curves (flow, head, power, efficiency, NPSH)
- Motor data
- Dimensional drawings
- Options
- Data sheet printouts
- Document downloads incl dxf files

The search by application guides users not familiar with the product range to the right choice.

FURTHER PRODUCT SELECTION AND DOCUMENTATION

Xylect

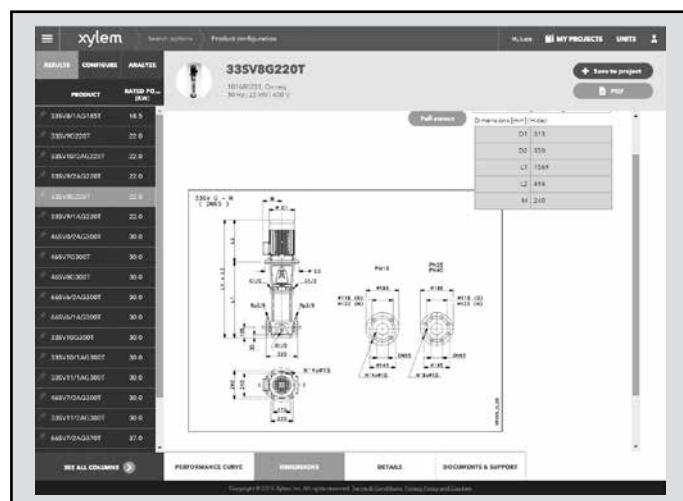

The detailed output makes it easy to select the optimal electric pump from the given alternatives.

The best way to work with Xylect is to create a personal account. This makes it possible to:

- Set own standard units
- Create and save projects
- Share projects with other Xylect users

Every registered user has a proper space, where all projects are saved.

For more information about Xylect please contact our sales network or visit www.xylect.com.

Dimensional drawings appear on the screen and can be downloaded in dxf format.

Xylem |'ziləm|

- 1) The tissue in plants that brings water upward from the roots;
- 2) a leading global water technology company.

We're a global team unified in a common purpose: creating advanced technology solutions to the world's water challenges. Developing new technologies that will improve the way water is used, conserved, and re-used in the future is central to our work. Our products and services move, treat, analyze, monitor and return water to the environment, in public utility, industrial, residential and commercial building services settings. Xylem also provides a leading portfolio of smart metering, network technologies and advanced analytics solutions for water, electric and gas utilities. In more than 150 countries, we have strong, long-standing relationships with customers who know us for our powerful combination of leading product brands and applications expertise with a strong focus on developing comprehensive, sustainable solutions.

For more information on how Xylem can help you, go to www.xylem.com.
