

Paddock plate SG 40 without base

The paddock plate without substructure is vibrated directly into the ground:

1. Level the surface and remove stones (if necessary)
2. Lay the SG 40 paddock plate with the grid facing upward
3. Vibrate the paddock plates into the ground using a large vibrating plate compactor
4. Lightly scatter sand into the plates

No earthworks, no gravel or crushed stone required!

Simply lay it on the grass, compact it, and you're done.

No special base is needed.

The **double safety interlocking system** keeps the grids firmly connected during installation and especially afterward.

“The SG 40 paddock plate can be used on both sides. You can choose how to lay the grid: with the base facing up or down.”

Depending on the ground, the SG 40 paddock plate is driveable. It impresses with extreme load capacity of up to **500 tons per square meter**, while maintaining low weight.

Thanks to the specially developed active double safety interlocking system, the mats remain firmly connected even during installation.

Fast and secure installation is possible.

Advantages of the SG 40 paddock plate:

- Can be installed on almost any surface (including muddy areas)
- Plates are secured against slipping and edge lifting
- The surface can be driven on with a tractor

Dimensional deviations of up to 2% are possible and are within tolerance for products made from plastic and recycled rubber.
